

# Panic Dialer and Activation Button

- Button is recessed to prevent accidental activation
- Dialer module calls out to pre-programmed number
- Dialer module can deliver an optional pre-recorded message of up to 1 minute long

# Panic Dialer and Activation Button

- Panic-button emergency dialers allow calls for assistance to be placed to law enforcement offices silently via pre-recorded messages directing them to the location of the activation button.
- All panic button installations on UW campuses must be approved by the requester's local campus safety (UW Bothell, UW Seattle, UW Tacoma) office before deployment.
- Installation of a dedicated analog line is required for each dialer.
- Each dialer has 2 programmable inputs for activation buttons.
- Each input can have its own outgoing message, or both inputs may use the same single message.

## Panic Dialer and Activation Button

- The initial cost and future repair or replacement of the dialer and activation buttons are included in the current installation and monthly service charges for the analog line service.
- Further installation costs may be required if additional communication infrastructure is required to mount the activation buttons in a requested location. UW-IT will meet with requesters to determine if additional facilities need to be installed before the dialer and buttons can be installed.
- Estimates for additional facilities, if needed, will be provided for the requester's acceptance.
- Periodic testing of the activation buttons and dialer is required to ensure confidence that the equipment is working as intended. UW-IT recommends monthly tests be coordinated with the local campus safety office. Testing is the responsibility of the customer after the initial installation is completed.
